

I'm not robot!

The Pirates know that X marks the spot where the treasure is!

Starting at your boat, can you direct the Boat to get the treasure before the Pirates get to it?

Remember **not** to go over:

- the Pirates
- the Pirate ship
- the shark
- the lighthouse

The boat can safely go over anything else in the sea.

When you finish draw your route on the map with a coloured pencil.

You can see a list of supported browsers in our Help Center. Help Center Hans Wilhelm has written and illustrated over 200 books for children and adults. Many have been translated into more than thirty languages and have become successful animated television series that are enjoyed by children all over the world. The total sales of his books have exceeded 42 million copies worldwide. For more information visit [www.hanswilhelm.com](http://www.hanswilhelm.com) I received \$100 for my frog drawing that appeared on the front cover of the July 1986 issue of Ahoy! (mouse over to see inside page). Commodore 64 (built into the keyboard) with monitor and floppy disk drive (image taken from the internet) In 1984, twelve years after I dropped out of my computer science course because of apathy, I was excited about getting back into programming. I purchased a Commodore 64 with 64 kb of memory, a monitor, a tape drive and a manual to learn to program in BASIC. I delved into the manual and before finishing it, I wrote my first program, Checklist, a utility for creating lists. For instance, when planning camping trips one could use it to make a list of items to bring and then check them off. Checklist was simply and utterly unsophisticated, yet at that time such programs were in demand. I submitted it to the popular Compute! Magazine, but they rejected it. Then I sent it to Ahoy!, a computer magazine based in New York. Back then, personal computers were for serious hobbyists since the nascent machines required at least rudimentary programming. And since few commercial programs were available, you usually resorted to writing your own programs or typing them from magazines. For me, the fun, challenge and excitement came from writing my own programs. To my delight, Ahoy! published Checklist and mailed me a cheque. So I got serious. Since tape drives were notoriously slow, I purchased a Commodore 1541 floppy disk drive that used 170 kb, 5-inch disks. And I finished reading the manual. Over the next few years, I wrote ten more programs ranging from games to utilities, and Ahoy! published them all. I earned \$300 to \$500 for each program (worth about twice that today). Getting published wasn't difficult. There were few programs available but plenty of demanding C64 enthusiasts. About 15 million Commodore 64s were sold in its lifetime making it the best-selling, single personal computer model of all time. And since programs were scarce - the internet hadn't yet made its way into homes - C64 aficionados often turned to computer magazines that published type-in programs. I wrote my first programs in BASIC but later I began programming in Assembler, a low-level language. Compared with BASIC, Assembler was much more difficult to write code for but incredibly fast. But publishing my programs made me conscious of my shortcomings as a writer. With each program, I had to include an instructive article. I felt behooved to learn to write well, so I studied writing, grammar and punctuation. As much as I enjoyed programming, I found I also looked forward to writing the accompanying article. I also tried my hand at computer art. Ahoy! published a few of my drawings although I didn't receive any remuneration for any except one, the drawing of a frog which appeared on the front cover of the July 1986 issue. After that issue came out, I had an amusing encounter at Hindson's Computing (now defunct), a computer store in Calgary. I was talking to Eric Hindson, the owner and manager, when a guy approached us. He had a question for the manager. "Do you have a file of 'Bob Spirko's frog?'" he asked. Eric waved a hand at me and said, "Why not ask him yourself?" The young man was so astonished, he jumped back a step. "I thought you were an American!" he exclaimed. I arranged to get him a copy of my frog drawing. In the late '80s, faced with stiff competition from other manufacturers such as IBM and Apple, Commodore's popularity began to decline. Commodore replaced the C64 with a mouse-driven computer, the Amiga (my last two programs were written for it), but it failed to catch on. As interest in Commodore computers waned, so
